

The use of the CLEANEST and its effectiveness have been clinically proven and well documented in both orthopaedic surgeries and in wound management.

In orthopaedic surgeries, the CLEANEST uses powerful pulsed irrigation to thoroughly clean up the cancellous bone bed by washing away blood and debris, making possible a much improved bone to cement interface and subsequently longer survival of the prosthesis while also reducing infection rate and risk of fat embolism.

In various types of wound debridement from burn to trauma to chronic wounds, the CLEANEST effectively and efficiently removes more than 90% of the necrotic tissues, foreign contaminants and bacteria; facilitates a faster healing process while greatly reduces infection rate
